

If there is any problem like:

Step 1: Open PowerShell as Administrator

1. Press the **Windows Key**.
2. Type **PowerShell**.
3. Right-click **Windows PowerShell** and choose **Run as administrator**.

Step 2: Clear Visual Studio Component Cache

This script automatically safely terminates any running Visual Studio processes and wipes out the cached UI components that cause the data wizard to crash.

Copy and paste this script into your PowerShell window:

powershell

```
# 1. Force close Visual Studio to unlock the cache files
Stop-Process -Name "devenv" -Force -ErrorAction SilentlyContinue

# 2. Navigate to the local AppData folder for Visual Studio
cd "$env:LOCALAPPDATA\Microsoft\VisualStudio"

# 3. Find and delete all ComponentModelCache folders safely
Get-ChildItem -Path . -Recurse -Directory -Filter "ComponentModelCache"
| ForEach-Object {
    Write-Host "Clearing Cache in: $($_.FullName)" -ForegroundColor Cyan
    Remove-Item $_.FullName -Recurse -Force
}

Write-Host "Visual Studio cache successfully cleared!" -ForegroundColor Green
```

Step 3: Clear the Hidden .vs Folder in Your Project

If the wizard still crashes after clearing the main cache, the corruption is inside your specific project folder. Run this script to completely wipe out the local workspace state.

Copy and paste this into PowerShell (make sure to update the first line with your path):

powershell

```
# 1. CHANGE THIS PATH to your actual project folder location
$ProjectPath = "C:\Users\YourName\Source\Repos\YourSolutionFolder"

# 2. Force close Visual Studio first
Stop-Process -Name "devenv" -Force -ErrorAction SilentlyContinue

# 3. Target and delete the hidden .vs directory
$VsFolder = Join-Path $ProjectPath ".vs"
if (Test-Path $VsFolder) {
    Write-Host "Removing hidden workspace states from: $VsFolder" -
ForegroundColor Cyan
    Remove-Item $VsFolder -Recurse -Force
    Write-Host "Hidden project states successfully wiped!" -
ForegroundColor Green
} else {
    Write-Warning "Could not find a .vs folder at the specified path.
Verify your path string."
}
```

Step 4: Re-open Visual Studio with Clean Slate

After running the scripts above, launch Visual Studio using Administrator mode directly from the command line to ensure it has full access permissions to connect to your SQL Server:

powershell

```
Start-Process "devenv.exe" -Verb RunAs
```

Once it opens, open your solution, click **Build -> Clean Solution**, then **Rebuild Solution**, and try running your Entity Framework setup again.
